

**Overview:**

We gather LA Tech faculty name and email address from the faculty website and input that information into an email template to then send our scam email. Our scam email can be activated by simply running the command "bash execute" after downloading all of our program files. This command will run each file necessary to send the email. The first program this command will run is the webScraper.py file which gathers the faculties name and email addresses from the tech website. It then puts that information into a file called info. Then it will run the infoGather.py which isolates the names and email addresses and puts that information into another file called finished. Then it runs the splitInfo.py which puts all the names and emails into dictionaries. Then it runs emailSend.py which takes the dictionary and sends all the emails out. At the end of the command, the info file and finished file are deleted.
