When first looking at the code, it appears to be in the programming language C. There's not much to the program other than the main function and an empty for loop with one line of code inside the for loop. The for loop indicates that this will be an infinite loop and the one line of code in the for loop is a call back on the program itself. So this little bit of code will ultimately cause the system to crash as it's an infinite loop calling on itself over and over. Someone who is trying to attack someone's system could just run the program and it could cause the computer to completely crash. I would deal with this attack by trying to just reboot my system to stop the program from running.
